Abstract

The study evaluated the efficacy and tolerance of the active components of "phytostimolin" cream and vaginal lavage, Triticum Vulgare and Ether glycoethylen-mono-phenolic, in 40 patients suffering from dystrophic cervico-vaginal pathologies (group 1), and in 20 patients following DTC of the portio due to ectropion (group 2). The study was double blind. An overall efficacy of 70% was observed in group 1 and 90% in group 2. The results obtained, the absence of side effects, and the good level of tolerance confirm the value of the above components in the pathology in question.
